

ABSTRACT OF THE DISCLOSURE:

An information transmitting apparatus includes: a job status management unit (e.g., a controller made up of a micro computer and other components) for managing the job statuses of transmitting information of the first and second information transmitting devices (e.g., a facsimile unit and e-mail facsimile unit); a display unit(display portion) for displaying the transmission status of jobs in each information transmitting device managed by the job status management unit; and a display controller(e.g., a controller made up of a micro computer and other components) for determining, based on the destination designated by a destination designating device(operation control portion), which transmission status of jobs of the first or second information transmitting device should be displayed on the display unit.
